SOFTWARE DOSILIGHT
Dosimeter management and analysis software for a single acces point

Product description:

dosiLight: stand-alone solution directly connected to a local PC and single point of attribution and can host up to 2x4 APDs.

dosiLIGHT offers a stand-alone, cost effective alternative to a dosiNET and suited for smaller organizations. In such environment only a single dosimeter access point is required. In dosiLIGHT communication to the attribution units, the management of the user's data and their dose exposure measurements are integrated in a single software package running on a standard PC.

All the functionality available in the dosiNET system is also available in dosiLIGHT. The limitation is that up-to 2 table-top attribution units with up to 4 dosimeters each can be connected to the host PC

dosiLIGHT comes with a software installer which guides though the installation and configuration. This eliminates the needs for an on-site installation intervention and the associated costs. So, if you only need a few APDs to track dose exposure in real-time, dosiLIGHT is a cost effective alternative without any compromise on functionality or performance.
